

Lab 2: Agile Backlog Creation & Sprint Simulation in Jira

Name:- A R AKSHAY KUMAR

SRN:- PES1UG24CS705

1) Screenshot of Jira with Epics and User Stories:-

2) Screenshot of Story point assignments:-

3) Screenshot of Burndown chart:-

4)Reflection Questions:

1. Did your estimations reflect the actual effort?

Ans:- Mostly yes. The initial estimates were reasonably close to the actual effort required for most tasks. However, some tasks took longer than expected because of implementation and testing issues. This shows that future estimates can be improved by considering dependencies, testing time, and possible technical difficulties.

2. Was your backlog well-prioritized?

Ans:- Yes. The backlog was prioritized according to the importance of the features and the needs of the target users. High-priority tasks related to the core functionality of the **OpenAPI Mock Server Generator** were addressed first, while less critical features were kept for later. This helped the team focus on delivering the main functionality within the sprint.

3. How did your simulated sprint align with your plan?

Ans:- The simulated sprint aligned **reasonably well with our initial plan**. We completed most of the planned tasks within the sprint and focused on the core features of the **OpenAPI Mock Server Generator**. A few tasks required more effort than expected, but overall the sprint followed the planned priorities and helped us identify areas where our planning and estimation could be improved.

4. What insights did the burndown chart give about your team's capacity?

Ans:- The burndown chart showed that our team had a **steady rate of progress**, with work being completed throughout the sprint rather than only at the end. It also helped us see that some tasks took longer than estimated, which affected the pace of completion. Overall, the chart gave us a better understanding of our **realistic sprint capacity** and will help us make more accurate estimates for future sprints.
